

K-FORM

Concrete shuttering made easy.

“Such a simple and effective product. I wish this had been invented sooner.”

K-FORM makes concrete shuttering easy - easy to save time and labour, easy to use, easy to pour more concrete per day and easy to save money.

K-FORM out-performs traditional steel shuttering in nearly every aspect of application and can be used in a great many locations (such as petrol forecourts) where steel shuttering cannot.

How K-FORM Works:

K-FORM is ideal for concrete slabs of 150mm to 200mm. The 135mm section is simply bedded down on a lean mix or mortar to the required finished height:

1. Lay down your string line
2. Cut the first top strip in half and attach to the first shutter. Fit end-clip.
3. Place spots of bedding mortar on the sub-base at intervals of 800mm to correspond with the holes in the base.
4. Place the shutter on the mortar and gently tap down with a rubber mallet until the top of the wear strip is at the desired level.
5. Place more bedding mortar as above for next shutter.
6. Join the second shutter to the first with the end-clip.
7. Fit the full length of the top strip across shutters.
8. Tap down the shutter as above.
9. Each 3m K-FORM beam has pre-drilled 24mm holes for steel dowel bars.
10. Once the bedding mortar has cured, you can start pouring concrete.
11. K-FORM stays in place, therefore adjoining bays can be poured one after the other.
12. When the concrete has cured, the top strip can either be left in place or removed. The gap can subsequently be filled with a joint sealant.

K-FORM: Winner

SED Award for Excellence
in Concrete Innovation

With K-FORM's removable top strip there is no need to diamond cut joints for sealant.

With K-FORM you can pour more concrete: Just set out your shuttering and pour bay after bay.

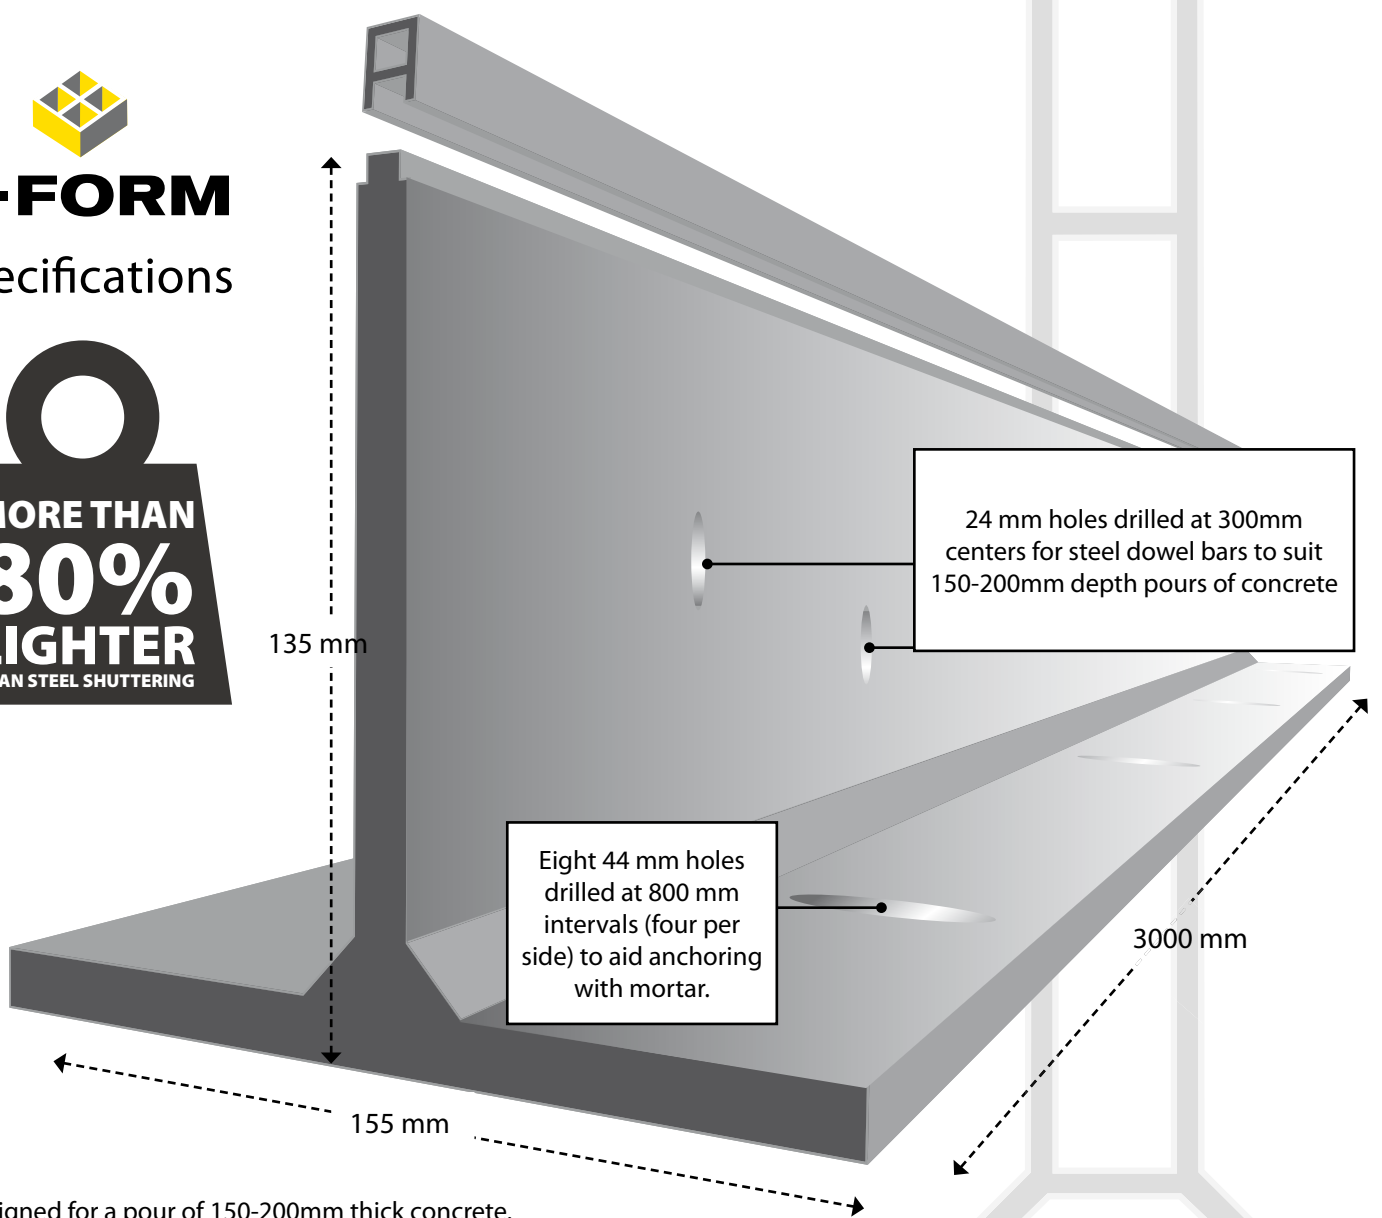

K-FORM's patented design allows concrete to set without any need to use additional expansion joints.

K-FORM

Specifications

- Designed for a pour of 150-200mm thick concrete.
- Enables adjoining bays to be poured consecutively.
- Pre-drilled holes in base for anchoring with mortar.
- Pre-drilled holes in vertical face for locating steel dowel bars.
- The profile is made in PVC and has a built in expansion joint.
- Once concrete is poured, K-FORM is left in place; no need to remove and clean.
- Separate wear strip can be removed once concrete is set to allow joint sealing.

Why Choose K-FORM?

K-FORM is so simple to use that just one person can lay a complete shuttering system. With no heavy lifting, or health and safety issues, the 3 metre beams can quickly be cut to length on site with a hand saw. No specialist tools are required.

Once the concrete has been poured, K-FORM remains in place, so even more time is saved; no removing, no cleaning and no storing.

Benefits Of Using K-FORM:

- Saves money.
- Saves time.
- No specialist tools required.
- Lightweight - over 80% lighter than steel shuttering.
- One person can install.
- Reduces labour costs.
- Increases pouring.
- Completes the project quicker.
- No removal afterwards.
- No cleaning.
- Non-metallic.
- Fuel and Oil resistant.
- Integral expansion joint.
- 'Click-together' ease.
- Safe to use when concreting petrol forecourts.
- Pre-drilled holes for steel dowel bars.
- Manufactured in durable PVC.
- Never rots or rusts.
- No anchoring with metal stakes.
- Available in 3 metre beams.
- Simple to use.
- Pour more concrete per week.
- Removable top strip.
- Easy to seal concrete sections.
- Non-conductive.
- No diamond cutting.
- Can be used with twin beams, bunyan rollers & vibro strikes.
- No puncturing of DPM.
- Made from recycled materials.
